

## Text Classification Homework

The goal is to **create a classifier** for **spam/ham** based on the dataset found at:

<https://www.kaggle.com/uciml/sms-spam-collection-dataset> --> spam.csv

A copy of the dataset is available at: <https://github.com/gwohlgen/misc/blob/master/spam.csv>

1. (You can run it on your own computer, or eg. Google CoLab (which is free))
2. Convert the dataset to the flair (fasttext \_\_label\_\_) format
3. Create and evaluate a classifier for flair
4. Try a few different settings for embeddings and hyperparameters
