Publish a (mini) dataset of your choice

The goal here is to convert a dataset from a given format like CSV, JSON (eg extracted from a relational database) to Linked Data.
(see the slides of unit 8 for necessary background information)

Steps:
1. Select a random (small) input data set of your choice. Eg some database table(s) saved as .csv or JSON.
2. **Transform the data to Linked Data.**
   a. Decide which ontologies (vocabularies) you can use
   b. Write a script to transform into LD (or use R2RML for example)
   c. Link to existing datasets (eg with owl:sameAs links etc)
3. Test the dataset, load with `rdflib`[1] or any similar library
4. Make some (useful) **sample SPARQL queries** against the data
